Description

Description

The IBS parts cleaning device type L was specially developed for manual brush cleaning of parts contaminated with oil and grease using cold cleaning agents (petroleum-based hydrocarbon mixtures).

This version is a combination of an immersion bath with a special air distribution system and a manual brush cleaning process. The parts to be cleaned are placed in the liquid. After the device is closed, the cleaner is set in motion by a special air system, which supports the cleaning process.

With a medium-sized work surface (725 x 520 mm), a working height of 800 mm and a load capacity of up to 60 kg, this brush washer is suitable for cleaning medium-sized and heavier parts.

The sturdy powder-coated sheet steel construction and the robust galvanised slatted grating guarantee a long service life, while the lower drain and sloping drain ensure that everything flows back into the drum and the cleaner cannot overflow.

The convenient and safe foot switch technology is user-friendly and easy to operate.

The unique IBS special pump is the centrepiece of the IBS parts cleaners and is designed for use in IBS parts cleaners. The pump is self-priming, unpressurised and absolutely trouble-free and maintenance-free.

The complete IBS pump set type L is included in the scope of delivery
